< ロ > < 同 > < 回 > < 回 > < 回 >

- The boundary of the deformation space separates the representations into "discrete representations" and "non-discrete representations".
- Thurston's program (in '78) clarifies <u>what</u> the separation is : The Ending Lamination Theorem (settled by Brock, Canary and Minsky) tells us that the boundary (the separation) is parametrized by the end-invariants (Topological data +α).
- The study of the shape will clarify

How discrete and non-discrete representations are separated.

Problems on the shape are problems after Thurston's program.

Our strategy

- Trace functions are holomorphic functions on the ambient space and are local charts around the boundary.
- Holomorphic functions are very smooth (infinitesimally, complex linear). The local behavior of holomorphic functions on the bdy may reflect the (local) "shape" of the bdy (e.g. self-similality).
- For understanding the relation between the "shape" and end-invariants (Topology+α), we pose

Question 2 (My long-standing problem (of course, not popular))

Study holomorphic functions on the Bers closure from Thurston theory.

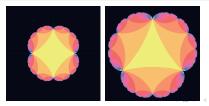

Our strategy

< □ > < □ > < □ > < □ > < □ >

Notation

From Function theory (and Theory of Kleinian groups):

- Σ_g : a closed orientable surface of genus $g \ (\geq 2)$.
- T_g : the Teichmüller space of genus g.
- d_T : the Teichmüller distance.
- $\mathcal{T}_{x_0}^B$: the Bers slice with center $x_0 \in \mathcal{T}_g$ ($\subset A^2(\mathbb{H}^*, \Gamma_0) \cong \mathbb{C}^{3g-3}$).
- $\partial \mathcal{T}^B_{x_0}$: the Bers boundary.

From Thurston theory:

- *ML*, *PML* : measured laminations and projective measured laminations on Σ_g.
- $\operatorname{Ext}_x(F)$: the extremal length of $F \in \mathcal{ML}$.
- ▶ SML_x : the unit sphere $\{F \in ML \mid Ext_x(F) = 1\}$ $(x \in T_g)$. $SML_x \cong PML$ via the projection $ML - \{0\} \rightarrow PML$.

Notation

Notation

From Thurston theory (continued):

- SML_x^{mf} : a subset of SML_x consisting of minimal, filling measured laminations.
- $\blacktriangleright SML_x^{ue}$: a subset of SML_x^{mf} consisting of uniquely ergodic measured laminations
- $\blacktriangleright \mathcal{PML}^{mf}$, \mathcal{PML}^{ue} : corresponding subsets to \mathcal{SML}_{x}^{mf} and \mathcal{SML}_{x}^{ue} .

Proposition 1 (follows from two big theorems: DLT and ELT)

For $x \in \mathcal{T}_{q}$, there is a continuous map

$$\Xi_x : \mathcal{SML}_x^{mf} \cong \mathcal{PML}^{mf} \xrightarrow{onto} \partial^{mf} \mathcal{T}_{x_0}^B \subset \partial \mathcal{T}_{x_0}^B$$

which induces a homeomorphism $\mathcal{SML}_x^{ue} \cong \mathcal{PML}^{ue} \to \partial^{ue} \mathcal{T}_{r_o}^B$.

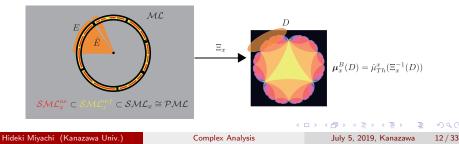

Notation

From Thurston theory (continued):

- μ_{Th} : The Thurston measure (MCG-invariant measure on \mathcal{ML}).
- $\hat{\mu}_{Th}^{x}$: A Borel measure on \mathcal{SML}_{x} defined by

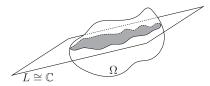

$$\hat{\mu}_{Th}^{x}(E) = \frac{\mu_{Th}(\{tF \mid F \in E, 0 \le t \le 1\})}{\mu_{Th}(\{tF \mid F \in \mathcal{SML}_{x}, 0 \le t \le 1\})} \quad (E \subset \mathcal{SML}_{x}).$$

• μ_x^B : the pushforward measure defined from $\hat{\mu}_{Th}^x$ via Ξ_x ($x \in \mathcal{T}_g$), which is a Borel measure supported on $\partial \mathcal{T}_{x_0}^B$.

Complex analysis and Demailly's theory

- An upper-semicontinuous function u on a domain Ω ⊂ C^N is said to be plurisubharmonic if for any complex line L(≅ C) in C^N with Ω ∩ L ≠ Ø, u |_{Ω∩L} is subharmonic on Ω ∩ L.
- A function u on a domain Ω ⊂ C^N is pluriharmonic if u and −u are plurisubharmonic. Any pluriharmonic function is locally the real part of a holomorphic function.
- A bounded domain Ω in C^N is said to be hyperconvex if it admits a continuous and non-positive plurisubharmonic exhaustion u (i.e. {x ∈ Ω | u(x) < r} is relatively compact for each r < 0).</p>

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

Complex analysis and Demailly's theory

Theorem 2 (Demailly (1987))

Let Ω be a hyperconvex domain in \mathbb{C}^N . There is a positive Borel function \mathbb{P}_Ω on $\Omega \times \Omega \times \partial \Omega$ and a family $\{\mu_x^\Omega\}_{x \in \Omega}$ of Borel measures supported on $\partial \Omega$ such that

•
$$d\mu_y^{\Omega} = \mathbb{P}_{\Omega}(x, y, \cdot) d\mu_x^{\Omega}$$
 for $x, y \in \Omega$; and

• any pluriharmonic function u on Ω which is continuous on $\overline{\Omega}$ satisfies

$$u(x) = \int_{\partial\Omega} u(z) d\mu_x^{\Omega}(z) = \int_{\partial\Omega} u(z) \mathbb{P}_{\Omega}(x_0, x, z) d\mu_{x_0}^{\Omega}(z)$$

for fixed $x_0 \in \Omega$. Thus, \mathbb{P}_{Ω} is the Poisson kernel for pluriharmonic functions and μ_x^{Ω} is the pluriharmonic measure at $x \in \Omega$.

< ロ > < 同 > < 回 > < 回 > < 回 >

Complex analysis and Demailly's theory

Theorem 3 (Demailly (1987))

Any hyperconvex domain $\Omega \subset \mathbb{C}^N$ admits a unique pluricomplex Green function g_{Ω} .

We do not give the definition of the pluricomplex Green function here, but the pluricomplex Green function is very important to calculate the Poisson kernel. Roughly speaking,

$$\mathbb{P}_{\Omega}(x, y, \zeta) = \lim_{z \to \zeta} \left(\frac{g_{\Omega}(y, z)}{g_{\Omega}(x, z)} \right)^{N}$$
(1)

for $\zeta \in \partial \Omega$ (if the limit exists).

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

Complex analytic property on Teichmüller space

▶ Teichmüller space is hyperconvex (Krushkal). For instance,

$$u(x) = -\frac{1}{\operatorname{Ext}_x(F) + \operatorname{Ext}_x(G)}$$

is continuous non-negative plurisubharmonic exhaustion on $\mathcal{T}^B_{x_0} \cong \mathcal{T}_{g,m}$, when $F, G \in \mathcal{ML}$ fill Σ_g up (M).

The pluricomplex Green function is obtained as

$$g_{\mathcal{T}_{g,m}}(x,y) = \log \tanh d_T(x,y)$$

for $x, y \in \mathcal{T}_{g,m}$ (Krushkal, M).

The Bers slice T^B_{x0} is polynomially convex (Shiga): holomorphic functions on the ambient space is dense in the space of holomorphic functions on T^B_{x0} ≅ T_{g,m} in the compact open topology.

Complex Analysis

July 5, 2019, Kanazawa 17 / 33

э

イロン イロン イヨン イヨン

Poisson integral formula

Theorem 1 (Pluriharmonic measure and Poisson kernel)

For the Bers slice $\mathcal{T}^B_{x_0}$, we have

$$\boldsymbol{\mu}_{y}^{B}(E) = \int_{E} \mathbb{P}(x, y, \varphi) d\boldsymbol{\mu}_{x}^{B}(\varphi) \quad (E \subset \partial \mathcal{T}_{x_{0}}^{B})$$

where \mathbb{P} is a measurable function on $\mathcal{T}_g imes \mathcal{T}_g imes \partial \mathcal{T}^B_{x_0}$ defined by

$$\mathbb{P}(x, y, \varphi) = \begin{cases} \left(\frac{\operatorname{Ext}_{x}(F_{\varphi})}{\operatorname{Ext}_{y}(F_{\varphi})}\right)^{3g-3} & (\varphi \in \partial^{ue}\mathcal{T}_{x_{0}}^{B}), \\ 1 & (otherwise) \end{cases}$$
(2)

where F_{φ} is the measured lamination whose support is the ending lamination of the Kleinian manifold associated to φ .

Hideki Miyachi (Kanazawa Univ.)

3

イロト イポト イヨト イヨト

Poisson integral formula

Theorem 2 (Poisson integral formula)

Let u be a pluriharmonic function on \mathcal{T}_g which is continuous on the Bers closure. Then,

$$\begin{split} u(x) &= \int_{\partial \mathcal{T}^B_{x_0}} u(\varphi) d\boldsymbol{\mu}^B_x(\varphi) \\ &= \int_{\partial \mathcal{T}^B_{x_0}} u(\varphi) \mathbb{P}(x_0, x, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi) \end{split}$$

Polynomially convexity implies :

Any holomorphic function on $\mathcal{T}_{x_0}^B \cong \mathcal{T}_{g,m}$ is approximated by holomorphic functions represented by the Poisson integral formula.

19/33

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

Poisson integral formula

Theorem 3 (Schwarz type theorem)

J

Let V be a $\mu^B_{x_0}$ -integrable function on $\partial \mathcal{T}^B_{x_0}$, which is continuous on $\partial^{ue} \mathcal{T}^B_{x_0}$. Suppose that

$$\int_{\partial \mathcal{T}_{x_0}^B} V(\varphi) \overline{\partial} \mathbb{P}(x_0, x, \varphi) d\boldsymbol{\mu}_{x_0}^B(\varphi) = 0$$

as (0,1)-form on $\mathcal{T}_g.$ Then

$$P[V](x) = \int_{\partial \mathcal{T}^B_{x_0}} V(\varphi) \mathbb{P}(x_0, x, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi).$$

is a holomorphic function on \mathcal{T}_g satisfying

$$\lim_{x \to \varphi} P[V](x) = V(\varphi) \quad (\varphi \in \partial^{ue} \mathcal{T}^B_{x_0}).$$

Hideki Miyachi (Kanazawa Univ.)

Why Poisson integral formula?

Poisson integral formula and Schwarz type theorem gives an interaction

{Some hol.fns on \mathcal{T}_g } \rightleftharpoons {Meas. fns on $\partial \mathcal{T}_{x_0}^B$ with some condition}

where the condition of a function V on $\partial \mathcal{T}^B_{x_0}$ is

$$\int_{\partial \mathcal{T}^B_{x_0}} V(\varphi) \overline{\partial} \mathbb{P}(x_0, \cdot, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi) = 0$$

as a (0,1)-form on \mathcal{T}_g .

I suspect that the interaction induces the isomorphism

 $\{\mathsf{Bdd hol.fns on } \mathcal{T}_g\} \rightleftharpoons \{L^{\infty}\text{-fns on } \partial \mathcal{T}^B_{x_0} \text{ with the condition}\}$

as complex Banach spaces (my ongoing project).

Notice that every holomorphic function on the Bers closure is bounded (because the Bers closure is compact).

Hideki Miyachi (Kanazawa Univ.)

Complex Analysis

July 5, 2019, Kanazawa 21 / 33

Why Poisson integral formula?

$$\int_{\partial \mathcal{T}^B_{x_0}} V(\varphi) \overline{\partial} \mathbb{P}(x_0, \cdot, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi) = 0$$

I suspect that the interaction induces the isomorphism

{Bdd hol.fns on \mathcal{T}_q } \rightleftharpoons { L^{∞} -fns on $\partial \mathcal{T}_{x_0}^B$ with the condition}

as complex Banach spaces (my ongoing project).

Notice that every holomorphic function on the Bers closure is

Hideki Miyachi (Kanazawa Univ.)

Complex Analysis

July 5, 2019, Kanazawa 21/33

Why Poisson integral formula?

r

$$\int_{\partial \mathcal{T}^B_{x_0}} V(\varphi) \overline{\partial} \mathbb{P}(x_0, \cdot, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi) = 0$$

I suspect that the interaction induces the isomorphism

{Bdd hol.fns on \mathcal{T}_q } \rightleftharpoons { L^{∞} -fns on $\partial \mathcal{T}_{x_0}^B$ with the condition}

as complex Banach spaces (my ongoing project).

Notice that every holomorphic function on the Bers closure is bounded (because the Bers closure is compact).

Hideki Miyachi (Kanazawa Univ.)

Complex Analysis

Why are boundary functions important?

- As noticed before, hol.fns are very smooth (infinitesimally, complex linear) and the local behavior of hol.fns on the bdy reflects the (local) "shape" of the bdy (e.g. self-similality).
- The Poisson integral formula is rewritten as

$$P[V](x) = \int_{\mathcal{PMF}} \hat{V}([H]) \left(\frac{\operatorname{Ext}_{x_0}(H)}{\operatorname{Ext}_x(H)}\right)^{3g-3} d\hat{\mu}_{Th}^{x_0}([H])$$

where \hat{V} is a measurable fn on $\mathcal{SML}_{x_0} \cong \mathcal{PML}$ (cont.on $\mathcal{SML}_{ro}^{mf} \cong \mathcal{PML}^{mf}$ if V is cont.on the Bers closure) defined by

$$\hat{V} = V \circ \Xi_{x_0}.$$

Connection between Complex analysis and Thurston theory

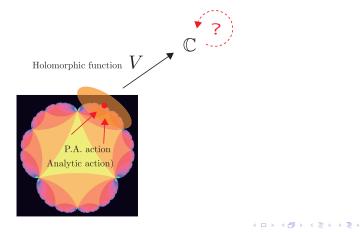

Bdy fns are fns on \mathcal{PML} (where is from the topological aspect!).

Hideki Miyachi (Kanazawa Univ.)

Why are boundary functions important?

Connection between Complex analysis and Thurston theory

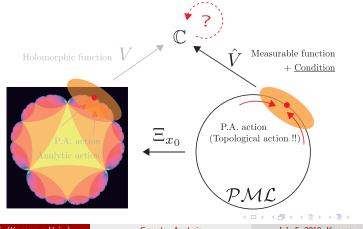

Boundary functions $\hat{V} = V \circ \Xi_{x_0}$ are measurable functions on \mathcal{PML} .

Why are boundary functions important?

Connection between Complex analysis and Thurston theory

Boundary functions $\hat{V} = V \circ \Xi_{x_0}$ are measurable functions on \mathcal{PML} .

Hideki Miyachi (Kanazawa Univ.)

Complex Analysis

July 5, 2019, Kanazawa 23 / 33

The condition for boundary functions is

$$\int_{\partial \mathcal{T}^B_{x_0}} V(\varphi) \overline{\partial} \mathbb{P}(x_0, \cdot, \varphi) d\boldsymbol{\mu}^B_{x_0}(\varphi) = 0.$$

The condition is rewritten as

$$\int_{\mathcal{PMF}} \hat{V}([H]) \left(\frac{\operatorname{Ext}_{x_0}(H)}{\operatorname{Ext}_x(H)}\right)^{3g-3} \frac{\overline{q_{H,x}}}{\|q_{H,x}\|} d\hat{\mu}_{Th}^{x_0}([H]) = 0 \quad (\forall x \in \mathcal{T}_g)$$

where

$$\hat{V} = V \circ \Xi_{x_0} \quad (\text{defined on } \mathcal{SML}_{x_0} \cong \mathcal{PML})$$

by Gardiner's formula and the definition of the measure $\mu_{x_0}^B$, where $q_{H,x}$ is the Hubbard-Masur differential on $x \in \mathcal{T}_g$ for $H \in \mathcal{ML}$.

Honestly speaking, it is hard to say easy, but I hope it is rewritten for application (and understanding the local behavior).

Hideki Miyachi (Kanazawa Univ.)

Complex Analysis

July 5, 2019, Kanazawa

Hideki Miyachi (Kanazawa Univ.)

Question 3

How do we rewrite the condition for use?

► To analyse the condition of bdy fns:

$$\int_{\mathcal{PMF}} \hat{V}([H]) \left(\frac{\operatorname{Ext}_{x_0}(H)}{\operatorname{Ext}_x(H)}\right)^{3g-3} \frac{\overline{q_{H,x}}}{\|q_{H,x}\|} d\hat{\mu}_{Th}^{x_0}([H]) = 0 \quad (\forall x \in \mathcal{T}_g),$$

we (probably) need to study the "infinitesimal structure" of the Bers boundary for localizing the condition.

For this, we will (or may) need to study (I suspect)

- the "infinitesimal" behavior of the map $\Xi_{x_0} : \mathcal{PML}^{mf} \to \partial^{mf} \mathcal{T}^B_{x_0}$ (\mathcal{PML} has PL structure)
- the "infinitesimal structure" of the ending lamination space (the space of end-invariants).

イロト 不得 トイヨト イヨト 二日

Problem : Is the condition easy to use?

Question 3

How do we rewrite the condition for use?

► To analyse the condition of bdy fns:

$$\int_{\mathcal{PMF}} \hat{V}([H]) \left(\frac{\operatorname{Ext}_{x_0}(H)}{\operatorname{Ext}_x(H)}\right)^{3g-3} \frac{\overline{q_{H,x}}}{\|q_{H,x}\|} d\hat{\mu}_{Th}^{x_0}([H]) = 0 \quad (\forall x \in \mathcal{T}_g),$$

we (probably) need to study the "infinitesimal structure" of the Bers boundary for localizing the condition.

- ▶ For this, we will (or may) need to study (I suspect)
 - the "infinitesimal" behavior of the map $\Xi_{x_0} \colon \mathcal{PML}^{mf} \to \partial^{mf} \mathcal{T}^B_{x_0}$ (\mathcal{PML} has PL structure)
 - the "infinitesimal structure" of the ending lamination space (the space of end-invariants).

25 / 33

イロト 不得 トイヨト イヨト 二日

Summary

Question 4 (Main problem (already appeared))

Study the shape of the deformation space of Kleinian groups

- Holomorphic functions on the ambient space are local charts on the boundary.
- Holomorphic functions on the Bers closures are represented by the Poisson integral.
- Boundary functions are thought of as measurable functions on *PML*.
- The "local complexity" of the Bers boundary reflects the local behavior of the boundary functions.
- We are looking for the condition of boundary functions for discussing the local behavior.

Idea of the proof

Idea

Use Demailly's theory.

- Determine the Poisson kernel
 - Applying Extremal length geometry (Kerckhoff, Gardiner-Masur, M).
 We can see

$$\lim_{z \to \varphi} \frac{g_{\mathcal{T}_{g,m}}(y,z)}{g_{\mathcal{T}_{g,m}}(x,z)} = \lim_{z \to \varphi} \frac{\log \tanh d_T(y,z)}{\log \tanh d_T(x,z)} = \frac{\operatorname{Ext}_x(F_{\varphi})}{\operatorname{Ext}_y(F_{\varphi})}$$

for $\varphi\in\partial^{ue}\mathcal{T}^B_{x_0}$ (cf. (1)). Notice the Kerckhoff formula

$$d_T(x,y) = \log \sup_{F \in \mathcal{MF}-\{0\}} \frac{\operatorname{Ext}_x(F)}{\operatorname{Ext}_y(F)} \quad (x,y \in \mathcal{T}_{g,m}).$$

Pluriharmonic measure coincides with the pushforward measure.

- Pluriharmonic measure is absolutely continuous w.r.t. the pushforward measure (+ Ergodicity of the MCG-action on *PML* (Masur)).
- (Technical part) Comparing the pluriharmonic measure and measures from extremal length.

Hubbard-Masur function is constant

Corollary 4 (Hubbard-Masur function is constant (Mirzakhani-Dumas))

The Hubbard-Masur function

$$\mathcal{T}_{g,m} \ni x \mapsto \operatorname{Vol}_{Th}(x) = \mu_{Th}(\mathcal{BML}_x)$$

is a constant function where $\mathcal{BML}_x = \{F \in \mathcal{ML} \mid \operatorname{Ext}_x(F) \leq 1\}.$

Hubbard-Masur function is constant

Corollary 4 (Hubbard-Masur function is constant (Mirzakhani-Dumas))

The Hubbard-Masur function

$$\mathcal{T}_{g,m} \ni x \mapsto \operatorname{Vol}_{Th}(x) = \mu_{Th}(\mathcal{BML}_x)$$

is a constant function where $\mathcal{BML}_x = \{F \in \mathcal{ML} \mid \operatorname{Ext}_x(F) \leq 1\}.$

Proof.

$$1 = \int_{\mathcal{PML}} \left(\frac{\operatorname{Ext}_{x_0}(F)}{\operatorname{Ext}_x(F)} \right)^{3g-3} d\hat{\mu}_{Th}^{x_0}([F])$$

= $\frac{1}{\operatorname{Vol}_{Th}(x_0)} \int_{\mathcal{BML}_{x_0}} \left(\frac{\operatorname{Ext}_{x_0}(F)}{\operatorname{Ext}_x(F)} \right)^{3g-3} d\mu_{Th}(F) = \frac{\operatorname{Vol}_{Th}(x)}{\operatorname{Vol}_{Th}(x_0)}.$

Representation of holomorphic quadratic differentials

Let V be a pluriharmonic function on $\mathcal{T}_{\!\!g,m}$ which is continuous on the Bers closure. Then,

$$V(x) = \int_{\mathcal{PML}} \hat{V}([F]) \left(\frac{\operatorname{Ext}_{x_0}(F)}{\operatorname{Ext}_x(F)}\right)^{3g-3} d\hat{\mu}_{Th}^{x_0}([F]),$$

$$(\partial V)_x = (3g-3) \int_{\mathcal{PML}} \hat{V}([F]) \left(\frac{\operatorname{Ext}_{x_0}(F)}{\operatorname{Ext}_x(F)}\right)^{3g-3} \frac{q_{F,x}}{\|q_{F,x}\|} d\hat{\mu}_{Th}^{x_0}([F]),$$

because of the Gardiner formula:

$$(\partial \operatorname{Ext}(F))_x = -q_{F,x} \quad (x \in \mathcal{T}_{g,m})$$

and $||q_{F,x}|| = \operatorname{Ext}_x(F)$, where $q_{F,x}$ is the Hubbard-Masur differential for $F \in \mathcal{ML}$ at $x \in \mathcal{T}_{g,m}$.

Representation of holomorphic quadratic differentials

For $\gamma \in \pi_1(\Sigma_g),$ let $\Theta_{\gamma,x}$ be a holomorphic quadratic differential with

$$d \operatorname{hLeng}_{\gamma}[v] = \operatorname{Re} \int_{M} \mu \Theta_{\gamma,x}$$

for $v = [\mu] \in T_x \mathcal{T}_g$ at $x = (M, f) \in \mathcal{T}_{g,m}$ (Gardiner, Wolpert).

Theorem 5

$$\Theta_{\gamma,x} = \frac{3g-3}{\sinh(\mathrm{hLeng}_{\gamma}(x)/2)} \int_{\mathcal{PML}^{mf}} \mathrm{tr}^2(\rho_{\varphi_{F,x}}(\gamma)) \frac{q_{F,x}}{\|q_{F,x}\|} d\hat{\mu}_{Th}^{x_0}([F])$$

where $\varphi_{F,x} \in \partial \mathcal{T}^B_{x_0}$ ($[F] \in \mathcal{PMF}^{mf}$) is the totally degenerate group whose ending lamination is the support of F.
